Sequence 27, Application US/09441340

Patent No. 6448476

GENERAL INFORMATION:

APPLICANT: Barry, Gerard F.

TITLE OF INVENTION: Phosphonate Metabolizing Play
FILE REFERENCE: 38-21(15303)

CURRENT APPLICATION NUMBER: US/09/441,340

CURRENT FILING DATE: 1999-11-16

EARLIER FILING DATE: 1998-11-17

NUMBER OF SEQ ID NOS: 32

SOFTWARE: Patentin Ver. 2.0
      Sequence 5, Application US/09068101
Patent No. 6372960.
GENERAL INFORMATION:
APPLICANT: PLANT GENETIC SYSTEMS N.V.
TITLE OF INVENTION: Improved Barstar Gene
FILE REFERENCE: 2121-139p
CURRENT APPLICATION NUMBER: US/09/068,101
CURRENT FILING DATE: 1998-08-26
EARLIER APPLICATION NUMBER: EP 96202446.9
EARLIER FILING DATE: 1996-09-03
NUMBER OF SEQ ID NOS: 10

Sequence 15, Application US/09186002B

Patent No. 6489542

GENERAL INFORMATION:
APPLICANT: Corbin, David R.
APPLICANT: Romano, Charles P.
TITLE OF INVENTION: Improved Method for Transforming Plants to Exp.
TITLE OF INVENTION: delta-Endotoxins
FILE REFERENCE: 38-21(13547) US Pat No. 6489542 09/186,002

CURRENT APPLICATION NUMBER: US/09/186,002B

CURRENT FILING DATE: 1998-11-04

NUMBER OF SEG ID NOS: 18

SOPTWARE: PatentIn Ver. 2.0

SEG ID NO 15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pSPORTI plasmid vector. The DH10B E. coli host was transformed with the ligation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note="Vector: pSPORT1 (Invitrogen); Site_1: SalI; Site_2: NotI; Mouse cDNA project by the Laboratory of Genetics, National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1533-1558 (2001). [PMID: 11544199]). Total RNAs were extracted from a pool of 1488 unfertilized eggs. Double-stranded cDNAs were synthesized with an Oligo (dT) primer [Invitrogen:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mixture by the standard chemical method. The average insert size is about 2.5 kb. The library was constructed by Yulan Piao (NIA)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inote="wector: pSPORTI; Site 1: Not I; Site 2: Sal I; Pive libraries representing BIO.5/12.5 pancreatic bud, E16.5 pancreas, newborn pancreas, adult pancreas, and adult islets of Langerhans were seperately constructed using SuperScript Plasmid Library kit (Life Technologies). cDNA was made by oligo-dT priming and size-selected by column fractionation. Libraries were amplified once on solid support and plasmid DNA from each library was prepared and mixed in equal amounts. The mixed library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded mixed library plasmid DNA was mixed with single-stranded mixed library plasmid DNA was mixed with inserts and hybridized to an Ecot of 6. Single-stranded (unhybridized to plasmids were isolated by hydroxyapatite chromatography and used to make this library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conservative

ORIGIN

```
(Stratagene); Site 1: ECORI; Site 2: XhoII; cDNA oligo dT-primed [5'-(GA) [0-ACTAGTCTCGAGTTTTTTTTT-3'] and directionally cloned using 5' linkers 5'-AATTCGGCACGAG-3' and 5'-CTCGTGCGG-3'. Size selection of -400bp material gives average insert size ranging from 1-2 kb. Library was mass excised (from lambda-UnizAP-XR) and resulting single-stranded phagenids were prepped and tranformed into DH10B. Library constructed and donated by J. McCarrey, Ph.D. (Southwest Foundation for Blomedical Research, Dept. of Genetics); excision done by E.M. Eddy, Ph.D. (National Institutes of Health, National Institute of Environmental Health Sciences)."

The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The DH108 E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 3.0 kb. The library was constructed by Yulan Piao."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lone-linker LL-Sal3 (include Sal1 sequence). The cDNAs were purified by phenol/chloroform and separated from free linkers by Centricon 100. Then, cDNAs were amplified by long-range high fidelity PCR using Takara's Ex Tag polymerase. Then, the cDNAs were purified by phenol/chloroform and by Centricon 100. The cDNAs were digested with Sal1 and NotI enzymes. Then, the cDNAs were size selected by Gibco's Size Fractionation Column. The cDNAs were 'cloned into Sal1/NotI site of pSPORTI plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by chemical method. The library was constructed by Xiaohong Wang and Yulan Piao."

The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pSPORTI plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.4 kb. The library was constructed by Yulan Piao (NIA)."

Construction of long-transcript enriched cDNA-libraries from submigrogram amounts of total RNAs by a universal PCR amplification Email: cdna@lgsun.grc.nia.nih.gov Plate: K0508 row: E column: 08 Seq primer: -2NM1 Forward High quality sequence stop: 609 National Institute on Aging/National Institutes of Health 333 Cassell Drive, Suite 4000, Baltimore, MD 21224-6820, USA On Dec 17, 2001 this sequence version replaced gi:17873145. Other\_ESTs: K0508E08-5N BM237875 BM237875.2 GI:31494430 Laboratory of Genetics Contact: Dawood 21429098 Genome Res. 11 (9), 1553-1558 (2001) Mus musculus Mus musculus (house mouse) POLYA=Yes. 11544199 quality sequence stop: 609 Conservative separated from free linkers by Centricon 100. Then, the CDNAs were amplified by long-range high fieldity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.5 kb. The library was constructed by Yulan Piao." /clone\_lib="NIA Mouse Hematopoietic Stem Cell (Lin-/C-Kit+/Sca-1+) CDNA Library (Long): // (Long-/C-Kit+/Sca-1+) CDNA Library (Long): // (Note-"Vector: pSPORT1 (Invitrogen); Site\_1: Sall, Site\_2: Notl; Mouse cDNA project by the Laboratory of Genetics, National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). Oryza sativa chromosome 3 BAC OSUNBa0078A17 genomic sequence
                                                                                                                                                                                                                                                                   Genes were identified by a combination of several methods: Gene prediction programs including Fgenesh (http://www.softberry.com/), genscan and Genscan+ (Chris Burge, http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky, http://GCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark/), and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org/, searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, cimple renamed as are predicted by tRNAscan-SE (Sean Eddy).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Submitted (03-MAY-2001) The Institute for Genomic Medical Center Dr, Rockville, MD 20850, USA 3 (bases 1 to 147344)

region ( reg	SOURCE INFORMATION: The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa and Minako Tateno in the laboratory of Pieter de Jong (http://www.chori.org) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org NEIGHBORING SEQUENCE INFORMATION: This sequence is the entire insert of the clone. Location/Qualifiers 1. 175440  1. 175440  1. 175440  1. 175440  1. 175440  1. 175440  1. 175440  1. 175440	NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.  This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.  MAPPING INFORMATION: MAPPING INFORMATION: Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional investor about the map position of this sequence, see	Submitted (24-APR-2003) Genome Sequencing Center, 4444 Forest Park Parkway, St. Louis, MO 63108, USA 6 (bases 1 to 175440) Wilson, R. Direct Submission Submitted (25-NOV-2003) Department of Genetics, Washington University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA On Apr 24, 2003 this sequence version replaced gi:29501931
